

Fisher Information Calculator

Multi-channel optimal reconstruction of $G(t)$ via Cramér–Rao bound

Model

$Y_i(t) = Y0_i \cdot (1 + c_i \cdot G(t)) + \text{noise}_i$ $\text{noise} \sim N(0, \sigma_i^2)$ $G(t) = A_{\text{base}} + A_{\text{amp}} \cdot \cos(2t)$ Fisher Information: $F = \sum_i [Y0_i^2 \cdot c_i^2 / \sigma_i^2]$ Cramér–Rao bound: $\sigma_G^2 \geq 1 / F$ Optimal estimate: $\hat{G}(t) = \sum_i (c_i \cdot Y0_i / \sigma_i^2)(Y_i(t) - Y0_i) / F$

Scalar Field Parameters

A_{base}

A_{amp}

Measurement Streams

Add independent measurement channels. Each stream $Y_i(t) = Y0_i \cdot (1 + c_i \cdot G(t)) + \epsilon_i$. More streams $\rightarrow$ tighter Cramér–Rao bound.

Stream	$Y0_i$	c_i	σ_i
